Example

- This is an example showing three (3) stations
- This is not even all of the data available for each station; just the values that interest me most
- Each station has about 30 API properties available, but only about half of those are truly useful

```
{
  "name": "Municipal Services Building Plaza",
  "latitude": 39.95378,
  "longitude": -75.16374,
  "addressStreet": "1401 John F. Kennedy Blvd.",
  "addressZipCode": "19102",
  "bikesAvailable": 5,
  "docksAvailable": 25,
  "totalDocks": 30
}
{
  "name": "Welcome Park, NPS",
  "latitude": 39.94733,
  "longitude": -75.14403,
  "addressStreet": "191 S. 2nd St.",
  "addressZipCode": "19106",
  "bikesAvailable": 12,
  "docksAvailable": 1,
  "totalDocks": 13
}
{
  "name": "40th & Spruce",
  "latitude": 39.9522,
  "longitude": -75.20311,
  "addressStreet": "246 S. 40th St.",
  "addressZipCode": "19104",
  "bikesAvailable": 3,
  "docksAvailable": 14,
  "totalDocks": 17
}
```

Using the API

* The primary Indego bike-share API GeoJSON file lists all stations
    * It is not REST-ful and does not offer any way to search for specific stations
* I created both a PHP and a Python library for accessing the API
    * My libraries sort of let you "search" for stations
* I would love to see expanded documentation of the API and a proper search feature
